Microirrigation Systems

Today on Gardening in a Minute: microirrigation systems.

Irrigation systems are a terrific convenience, but can waste precious resources and drain your wallet. You may want to think about purchasing a microirrigation system, which delivers water in precise amounts and at controlled frequencies directly to a plant’s roots.

Microirrigation systems are easy to install, and can distribute water in the form of droplets, streams, or sprays.

Dippers may be placed under mulch or buried in the soil to minimize visibility and damage.

Sprinklers and sprayers cover larger areas than drippers, and can be easier to maintain. Materials for your microirrigation system are readily available at garden centers and hardware stores, so select a microirrigation system for your landscape today to reduce your water use and expenses!

For more information on irrigation and many other gardening topics, contact your county Extension office or visit Gardening in a Minute dot com.

Gardening in a Minute is a production of the University of Florida’s Center for Landscape Conservation and Ecology, IFAS Extension, and WUFT-FM.
